

How to include Doxygen method description in Xcode's autocomplete popup?

[antoncelli](#) 3331410

Using Xcode , I want to have the Doxygen description of my method below the autocomplete option, like `alloc`:

When writing, Xcode displays the autocomplete with the comments from the documentation. You can see in the image for example, when `alloc` is selected from the options, it says "Returns a new instance of the receiving class" and also links to the documentation.

I have been able to document my source code with Doxygen, for instance

```
/**
 * This does nothing
 */
-(void) doNothing
{
    // This does nothing
}
```

and I get the expected results in the HTML file that Doxygen generates, yet I don't know how to make those results appear as suggestions in Xcode.
